The present sequence represents a fusion protein, comprising E7 and E6 CC polypeptides from human papillomavirus type 16 (HPV16). The fusion CC protein is designated E7E6PentM, and comprises an E7 amino terminus CC (where residues 24, 26 and 91 have been replaced with glycine) and an E6 CC (arboxy terminus (where residues 63 and 106 have been replaced with G1ycine). E7E6PentM is representative of fusion proteins of the CC glycine). E7E6PentM is representative of fusion proteins of the E7 polypeptides, where the E7 polypeptide has mutations at any one or more CC of the amino acids corresponding to amino acids 24, 26 or 91 of the Sequence given in ADO44073 and the E6 polypeptide has no mutations or has CC mutations at any one or more of the amino acids corresponding to amino CC acids 63 or 106 of there sequence given in ADO44072. The polypeptides of the invention are useful for treating or preventing human papillomavirus CC immune responses against HPV. They are also useful for treating lower gastrointesting tract cancers, e.g. and cancer, and other cancers of the animosetical cancer also useful for treating lower gastrointesting tract cancers, e.g. anal cancer, and other cancers of

The second protein is taken from a group including human Lymphocyte Activation Gene (hLAG)-3. The first protein is a viral or bacterial antigen, a tumor antigen, parasitic antigen, or their mixtures. The viral antigens can be for hepaticis B (HBV), human papillomavirus (HBV), hepatitis C (HCV), human immunodeficiency virus (HIV), Epstein-Barr virus (EBV), cytomegalovirus (CWV), and their combinations. The bacterial antigens can be intracellular bacteria of tuberculosis, leprosy and listeria. A vaccine of the invention has virucide, and antibacterial

These constructs are optionally linked to an immunological fusion partner and an immunomodulatory CpG oligonuclectide. The products of the invention can be used to induce arimmune response in a patient to an HPV antigen. They can also be used i preventing or treating HPV induced tumours
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Composition comprising induce immune response

The sequence also contains a histidine tag at the C-terminus of the encoded protein. The protein can be used in a vaccine, for immunotherapeutically treating HPV induced tumour lesions (benign or malignant) and preventing HPV viral infection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to human Papilloma virus (HPV) fusion proteins, linked to an immunological fusion partner that provides T helper epitopes to the HPV antigen. Vaccine formulations comprising the fusion proteins are useful in the treatment or prophylaxis of HPV induced lesions (papillomas, warts and cervical cancer). HPV 16 (and HPV 18) E6 and E7 proteins (singly, as an E6-E7 fusion or mutated) were fused to either Haemophilus influenzae D protein (20-127), the C-terminus of Streptococcus pneumoniae Lyta protein (CLyta) or thioredoxin. The present sequence represents a mutated HPV-H. influenzae D protein, fusion protein of the invention.

                                                                                                                                8
                                                                                                                                                                                                                                                                         CC The present sequence represents a fusion protein, comprising E7 and E6 CC polypeptides from human papillomavirus type 16 (HPV16). The fusion CC protein is designated E7E6TEHM, and comprises an E7 amino terminus (where CC residues 24 and 26 have been replaced with glycine) and an E6 carboxy CC terminus (where residues 63 and 106 have been replaced with glycine). CC S7E6TEHM is representative of fusion proteins of the invention. The CC where the E7 polypeptide human papillomavirus E6 and E7 polypeptides, CC where the E7 polypeptide has mutations at any one or more of the amino CC acids corresponding to amino acids 24, 26 or 91 of the sequence given in CC ADO44073 and the E6 polypeptide has no mutations or has mutations at any core or more of the amino acids corresponding to amino acids 63 or 106 of CC there sequence given in ADO44072. The polypeptides of the invention are CC useful for treating or preventing human papillomavirus (HPV)-associated CC cancers, such as cervical cancer. The fusion proteins and nucleic acids CC cancers fusion proteins are useful for generating immune responses CC against HPV. They are also useful for treating lower gastrointestinal CC tract cancers, e.g. anal cancer, and other cancers of the reproductive insured including papillomavirus cancers.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes a cell line comprising a cell that is a clone, derivative, mutant and/or transfectant of a cell line designated American Type Culture Collection (ATCC) PTA-4047. The cell upon culture grows continuously and retains the identifying characteristics of the cell line designated ATCC-4047. Also described is a process of making a cell line. The insect cell line sussful in replicating baculoviruses, as a host substrate for baculovirus plaque assays, as a source of insect proteins, acts as depot for cell transfection to produce recombinant baculoviruses, and in expressing viral recombinant proteins. Extracellular and intracellular viral recombinant proteins and virus-like particles expressed from the cell line are useful as pharmaceutical compositions, vaccines or diagnostic reagents. The present sequence represents a human papillomavirus type 16 (HPV-16) L2/E7/E2 fusion protein, which is used in the exemplification of the present invention.

The present invention describes a codon optimised polynucleotide encoding CC a viral capsid protein that self assemblee into a virus-like particle CC (VLP) that exhibits conformational antigenic epitopes capable of raising CC neutralising antibodies, where the VLP is expressed from a host cell comprising that a particle extracellularly. Also described: (1) a vector comprising the above codon coptimised polynucleotide operably liked to a eukaryotic or prokaryotic coption control element, capable of replication in prokaryotic and/or ce eukaryotic host; (2) a host cell comprising the vector; (3) a control element, capable of replication in prokaryotic and/or ce pharmaceutical or vaccine composition for treating, ameliorating or comparation and integration, comprising and thisplicity of VLPs that exhibit conformational antigenic epitopes, and ce acarrier, diluent or adjuvant; (4) a diagnostic kit for detecting a papillomavirus infection, comprising a multiplicity of VLPs that exhibit conformational antigenic epitopes, and cetection agent comprising a conformational antigenic epitopes, and a detection agent comprising a conformational antigenic epitopes, and a detection agent comprising a colons that are utilised at high levels in insect cells with codons that are utilised at high levels in insect cells with codons that are utilised at high levels in insect cells with codons that are utilised at high levels in insect cells in titally-modified sequence by choosing a preferred codon contitially-modified sequence by choosing a preferred codon cells towards about 1:1, where the ratio of GC nucleotide sequence creates towards about 1:1, where the number of palindromic and steen-loop pairs to AT nucleotide pairs in the further-modified nucleotide sequence is minimised, and (6) methods for treating, ameliorating or created above. The VLP has virucide activity and can be used in vaccines can sequence is minimised, and (6) methods for the present invention conformation and methods of the present invention can feet and the pr

The present invention describes a method for purifying a recombinant extracellular or intracellular virus-like particle (VLP). The method comprises harvesting a cell suspension comprising cells containing a plurality of VLPs to produce a harvested supernatant, optionally disrupting the harvested cells to produce cell lysates containing the VLP, clarifying the harvested supernatant, concentrating the clarifies supernatant, disfiltering the concentrated supernatant, and recovering the purified recombinant VLP. Also described: (1) a cell line designates
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      purification; recombinant extracellular virus-like particle; recombinant intracellular virus-like particle; HPV; infection; dysplasia; HPV-16; fusion protein.
                                                                                                                                                                                                                                                                                              Purifying a recombinant human papillomavirus (HPV) L1, useful for diagnosing, preventing or treating HPV infections, comprises clarifying, concentrating and diafiltering cells containing HPV particles.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Synthetic

The VLPs have virucide activity, and can be used in vaccines and in gene therapy. The method is useful in isolating and purifying expressed viral gene products, including VLPs, in vitro. The gene products or particles may be used in detecting, preventing or treating HPV infections and associated symptoms like dysplasia. The present sequence represents an HPV-16 L2/E7/E2 fusion protein, which is given in the exemplification of the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to chimeric virus-like particle comprising a recombinant viral capsid protein that encapsulates a recombinant viral protein during self assembly into a chimeric virus-like particle and exhibiting conformational antigenic epitopes capable of eliciting neutralising antibodies. The vaccine comprising the chimeric virus-like particles are useful for inducing immunity (humoral and/or cell-mediated immunity) against papillomavirus infection. The invention is also useful in gene therapy. The present sequence is HPV (human papillomavirus)-16
The peptide is the sequence of the human papillomavirus HPV 16 E7 nucleoprotein. Peptides corresponding to regions (pref. epitopic regions of HPV 16 E7 were synthesised by standard Merrifield synthesis. Examples of such peptides are E7 1-10, 29-50 or 70-81. Compositions contg. these

The proliferative state of a cell transformed with HPV can be evaluated in the following manner. Cyclin/cyclin-dependent kinase complexes containing protein p21CIP1 (AAW46807-88) are isolated from the transformed cell, and the HPV E7 oncoprotein added to the isolated protein. Cyclin/cyclin-dependent kinase complexes are isolated from an untransformed cell that is substantially homogenic with the transformed cell, and the HPV E7 oncoprotein added. The kinase activities of the 2 samples are measured, where a proliferating transformed cell has a greater kinase activity that the untransformed cell. The method is used for determining the extent of interaction and/or inactivation between a cyclin/cyclin-dependent kinase inhibitor and the HPV E7 oncoprotein and thus evaluating the proliferative state of a transformed cell.                                                                                                                               Ş
                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a novel assay for identifying compounds which ci inhibit viral replication and pathogenesis by increasing proteasomal replication and pathogenesis by increasing proteasomal rection. The method comprises reacting a compound with proteasomal protein (20% proteasomes separately with or without 19% and 11% complexes), viral gene product, and protein or peptide substrates; measuring protease activity; and identifying the compound as an inhibitor if the protease activity of the assay system is increased. The assays of the invention can be used to identify compounds which inhibit viral replication and pathogenesis, and compounds are of value in the treatment of viral compounds which increase proteasomal degradation of viral components or molecules induced by viral infection are of value in the treatment of viral disease. Compounds which inflammatory disease, and AIDS in HIV infected patients. The methods may caffed to proteasomal function to bacterial or viral damage.
                                                                                                                                                                                            Query Match

However, the type and severity of disease caused by the papillomavirus is dependent on the strain causing the infection. The present sequence represents the human papillomavirus 16 E7 protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes a fusion protein comprising 2 amino acids sequences from 2 different papillomavirus specific (PVS) proteins. The fusion protein may be administered for preventing and treating papillomavirus infections in humans and animals. Papillomaviruses are implicated in the pathology of malignant tumour formation in the anogenital tract (of these tumours, cervical cancer is the most frequent (50000 cases/year) and in the formation of precursor lesions of cervical intraepithelial neoplasia (CIN). Papillomaviruses also cause benign
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Pusion proteins comprising papillomavirus specific proteins useful for vaccinating against malignant tumors of the anogenital tract such as cervical carcinomas.

                                                                                               S
                                                                                                                                                                                                                                           The present invention describes an isolated prepared human papillomavirus (HPV) epitope (I). (I) has antiviral activity, and can be used in vaccine (C present invention are useful for stimulating nucleic acid compositions from the C present invention are useful for stimulating an immune response to HPV by c stimulating the production of CTL or HTL responses, specifically in the C manifested symptoms e.g. genital warts or neoplastic growth. The peptides can also be used in a tetramer staining assay to assess peripheral blood c mononuclear cells for the presence of antigen-specific CTLs following c exposure to a pathogen or immunogen, and as reagents to evaluate immune compositions are useful for removing warts or treating HPV infections. The epitopes for inclusion in an epitope-base vaccine may be selected c from conserved regions of viral or tumour-associated antigens, which c reduces the likelihood of escape mutants, also immunosupressive epitopes that may be present in whole antigens can be avoided with the use of c epitope-base vaccines. An additional advantage is the ability to combine c epitopes achieving enhanced immunogenicity, the major benefit of the composition of that is safe and efficacious. cc cyropiasmic translocation domain of a pseudomonas exotoxin A (ETA dII), cor a granulocyte-macrophage colony stimulating factor (GM-CSP); and (b) a cc second polypeptide domain containing an antigenic polypeptide. A cc composition comprising the chimeric polypeptide is useful for inducing an immune response such as a cytotoxic T cell response. The nucleic acid or vector encoding the chimeric polypeptide present in the composition is created as naked DNA by gene gun or equivalent, or by liposomal formulation. These are thus useful for vaccinating a mammal against composition is response to a pathogen. Preferably they care useful for vaccinating a mammal against a tumour antigen. The compositions and methods are useful for stimulating or enhancing the created monogenicity of a selected antigen or stimulating or enhancing a cellular immune response specific for that antigen. The chimeric nucleic acid molecules and vaccination methods, yield potent antigen-specific immunotherapy. The polynucleotides and DNA vaccines can induce a cellular immune response that is at least 40 fold more potent than conventional CC domesticated or agricultural animals, as well as humans, and have low cmmunogenicity

                                                                             CC dependent kinase-2 (CDK2) kinase (I) activity, comprising measuring (I) CC dependent kinase-2 (CDK2) kinase (I) activity, comprising measuring (I) CC activity on CDK2 substrate in the presence of human papillomavirus (HPV) CC E7 or its fragment, and in the presence and absence of test compound. The case of compound is identified as inhibitor of E7-induced (I) activity when CC decreased phosphorylation of CDK2 substrate is detected. The method is CC used for identifying inhibitor of E7-induced CDK2 kinase activity. This CC identifying an inhibitor of E7-induced increase in CDK2 kinase activity. This CC measuring viral proliferation in the presence and absence of identified cC inhibitor and identifying the inhibitor as an antiviral agent when CC decreased proliferation is detected, in the presence of the inhibitor. The CC compared to viral proliferation in the absence of the inhibitor. The CC dentified inhibitors are useful for reducing HPV E7-induced kinase activity or for ameliorating HPV proliferation by inhibiting E7-induced contivity or for ameliorating HPV proliferation by inhibiting E7-induced contivity or for inhibitors identified by the above method are useful for produced medicament for ameliorating viral infection e.g. HPV CC infection, adenoviral infection or similar virus 40 (SV40) infection. The CC correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Identifying E7-induced cyclin-dependent kinase-2 activity inhibitor, comprises identifying test compounds which reduce cyclin-dependent kina-2 substrate phosphorylation in presence of human papillomavirus E7 or

The method comprises measuring CDK2 kinase activity on a CDK2 substrate in presence of human papillomavirus (HPV) E7 (or fragment), in presence and absence of a test compound and measuring phosphorylation of substrate. The method is useful for identifying an inhibitor of E7-induced CDK2 kinase activity. The identified inhibitor is useful for reducing or inhibiting HPV proliferation in an individual. Inhibitors of E7 binding to the CDK2 complex are useful in preparing medicament for ameliorating viral infection e.g. HPV infection, adenoviral or SV40 infection. The present sequence represents a papillomavirus E7 fragment, which is used in the method of the invention. (Updated on 11-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Identifying inhibitors of human papilloma virus E7 protein-induced increase in CDK2 kinase activity for use as antiviral agent, by mekinase activity on CDK2 substrate in presence of E7 protein, test
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             11-SEP-2003

                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention describes a fusion protein comprising cell import and/or export signal sequences and an antigen which is suitable for immunizing an individual against a disease, together with a DNA that codes for said protein. The invention also relates to the use of the protein (II) and its encoding DNA (I) for immunizing an individual against diseases, in particular against infection-induced auto-immune and tumor diseases. This sequence represents a fragment of the human papillomavirus E7 protein used in the preparation of the fusion constructs described in the method
 Calreticulin; CRT; endoplasmic reticulum chaperone polypeptide; cytostatic; vaccine; human papillomavirus 16; HPV 16; E7; DNA venhanced antigen-specific immune response; cytotoxic T lymphocy tumour; cancer; cervical cancer.

The nucleic acid is useful as a vaccine (DNA vaccine) for inducing enhanced antigen-specific immune responses, particularly those mediated by cytotoxic T lymphocytes. The nucleic acid and compositions comprising the nucleic acid is also useful for inhibiting the growth of tumours and cancers e.g. cervical cancer. This is the amino acid sequence of the human papillomavirus type 16 (HPV 16) early gene 7 (E7) used in the creation of a DNA vaccine
                                                                                                                        Human papillomavirus 16; HPV 16; cancer; squamous cell carcinoma; adenocarcinoma; koilocytosis; hyperkerotosis; intraepithelial neo; intraepithelial lesion; dysplasia; head cancer; neck cancer; small cell lung cancer; melanoma; oncogene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New nucleic acids encoding a fusion polypeptide comprising an endoplasmic reticulum chaperone polypeptide linked to an antigenic polypeptide, useful as a vaccine for inducing antigen-specific immune responses.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention describes a novel peptide derived from the E2, E6 or E7 cc early coding region of human papillomavirus (HPV) 16 and 18, which is soluble in aqueous solution and has a lysine or cysteine residue near the camino terminus, very few tryptophan, methionine and cysteine residues, cc and/or many glycine and asparagine residues. The peptides and diagnostic concogenic HPV by using peptides derived from the E2 region, since HPV 16 and 18 are the main HPV genetic types associated with cancers, and cyrestine of antibodies to E2 protein is known to provide evidence of HPV cancers, and concert of the E7 region, since HPV 18 colored to be tumour-specially carcinoma by using peptides derived from the E6 or E7 regions, since E6 and E7 are thought to be tumour-specific cantigens. The peptides and diagnostic method are especially useful to diagnose cervical carcinoma (e.g. adenocarcinoma of the uterine cervix) and any HPV associated epithelial cell abnormality including high grade dysplasias, kollocytosis, hyperkerotosis, precancerous conditions compassing intraepithelial neoplasias or intraepithelial lesions, and invasive or malignant cancers. They are also used to detect head and neck cancers, small cell lung cancers, penal and anal squamous cell carcinomas and melanoma. This is the amino acid sequence of the E7 early coding region of HPV 16, an oncoprotein that destabilises cell carcinomas interaction with the cyclin-dependent kinase inhibitor concerning penal and anal squamous cell carcinomas cell carcinomas cells interaction with the expendent kinase inhibitor concerning penal and anal squamous cell carcinomas cells and cell accrinomas cells and cells and cell accrinomas cells and cells and cell control cells control through its interaction with the cyclin-dependent kinase inhibitor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Ś
                                                                                                                                                                                                                                                                                               뭐

                                                                                                                                                                                                                                                                                                                                                                                                                                            CC polypeptide, comprising a first nucleic acid sequence encoding a polypeptide, optionally, fused in frame with the nucleic acid, a linker polypeptide optionally, fused in frame with the nucleic acid, a linker concleic acid encoding a linker peptide, and a nucleic acid that is linked in frame to them, and that encodes an antigenic peptide or polypeptide. CC The nucleic acid molecule, polypeptides and vectors are useful as concleic acid molecule, polypeptides and vectors are useful as concleic for enhancing immune responses, primarily cytotoxic contingens for inhibiting growth or preventing re-growth of a tumour. CC lymphocytes (CTL) responses to specific antigens such as tumour or viral contingens, and for inhibiting growth or greventing re-growth of a tumour. CC particles without contamination from replicon-competent virus. The contamination from replicon-competent virus. The pathogenic organisms include viruses such as human papilloma virus (HPV), hepatitis B virus, hepatitis C virus, human immunodeficiency virus, bepatitis B virus and herpes simplex virus, intracellular parasites such as malaria, and bacteria that grow intracellular parasites such as malaria, and bacteria that grow intracellularly such as mycobacteria conditions.
                                                                                                                                                                                                                                밁

The epitope of the invention is useful for preventing and treating uterine cancer. The present amino acid sequen represents the human papillomavirus E7 antigen

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a novel purified complex comprising a first polypeptide and a second polypeptide, where the polypeptides comprise defined amino acid sequences listed in the specification, and where the first polypeptide binds to the second polypeptide. A complex of the invention has virucide and cytostatic activity, and may have a use as a vaccine. The complex is useful for identifying agents for treating or preventing a conditions involving altered level of the complex, e.g. human papilloma virus (HPV) infection, or cancer. The compositions, antibodies, vectors and methods are useful for treating such diseases. The sequences shown in ADF09500-ADF09583 represent proteins of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New purified complex comprising a first polypeptide and a second polypeptide, useful for identifying agents for treating/preventing a condition involving altered level of the complex e.g. human papilloma virus infection, or cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CC The present sequence is the protein sequence of human papillomavirus E7 CC conceptotein. E7 promotes oncogenesis through an inhibition of p22Cip21 CC transport into the nucleus. E7 abrogates Raf-associated arrest and CC prevents inhibition of cyclin E-CDK2 activity without disrupting Raf CC induction of p21Cip21. E7 neither interacts with p21Cip1 nor derepresses CC p21Cip1-associated CDK2 activity, but instead reduces the association CC between p21Cip1 and cyclin E-CDK2 complexes. Raf down-regulates steady-cc state levels of Akt, a regulator of p21Cip1 localisation, leading to loss CC of p21Cip1 phosphorylation and accumulation of p21Cip1. E7 disrupts the CC effects of Raf on Akt activity and prevents p21Cip1 nuclear accumulation. CC Maintenance of Akt activity is necessary and sufficient to bypass Raf CC arrest. The invention provides methods for identifying and using CC inhibitors of E7 cell proliferation activity, and for identifying and cusing compounds capable of promoting the nuclear localization of p21Cip1. The methods can be used to inhibit aberrant cellular proliferation for

                             The present invention relates to a method for generating an immune response to an antigen in a patient. The method comprises administering to the patient an immunoglobulin (Ig) or its portion where the Ig has at least one peptide epitope of the antigen attached to the Ig or its portion and administering the immunoglobulin or its portion in
                                                                                                                                                                                                                                                                               Generating an immune response to an antigen, useful desired T cell responses comprises administering an one peptide epitope of the antigen attached to the i

                                                                                                                                                                  The specification describes a method for constructing a synthetic polynucleotide from which a polypeptide is producible at a different level in a Chinese Hamster Ovary (CHO) cell compared to when using a parent polynucleotide encoding the same polypeptide. The method comprises selecting a first codon of the parent polynucleotide for replacement with a synonymous codon, where the synonymous codon is selected on the basis that it exhibits a different translational efficiency in the CHO cell than the first codon in a comparison of translational efficiencies of codons in test CHO cells. The method is useful for constructing synthetic polynucleotides which are translated more efficiently, compared to the parent polynucleotide. The present sequence represents Human papillomavirus type 16 (HPV16) E7 protein. The E7 polynucleotide was codon-modified, to demonstrate the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Constructing a synthetic polynucleotide, useful for producing a polypeptide at a higher level in a Chinese Hamster Ovary cell, compriselecting a first codon of the parent polynucleotide for replacement
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           WPI; 2004-270043/25.

                                                                                                                                                                                                                                                                                                                                                                                         The present sequence represents a wild type E7 protein from human papillomavirus type 16 (HPVI6), which is used to produce fusion proteins of the invention. The specification describes human papillomavirus E6 and E7 polypeptides, where the E7 polypeptide has mutations at any one or more of the amino acids corresponding to amino acids 24, 26 or 91 of the sequence given in ADO44073 and the E6 polypeptide has no mutations or has mutations at any one or more of the amino acids corresponding to amino acids 63 or 106 of there sequence given in ADO44072. The polypeptides of the invention are useful for treating or preventing human papillomavirus (HPV) -associated cancers, such as cervical cancer. The fusion proteins and nucleic acids encoding the fusion proteins are useful for generating immune responses against HPV. They are also useful for treating lower gastrointestinal tract cancers, e.g. anal cancer, and other cancers of the reproductive system, including penile and vulvar cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New polypeptide comprising human papillomavirus E6 and useful for treating or preventing human papillomavirus cancers, e.g. cervical cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human papillomavirus type 16. The invention also relates to vaccine formulations comprising viral capsomeres and methods for their production. The fusion protein is useful for treating or preventing a papilloma virus infection in an animal, particularly humans and is also useful in the production of vaccines. The present sequence is human papilloma virus (HPV) strain HPV16 E7 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New fusion proteins comprising an amino acid sequence from a first and a second papilloma-virus specific protein, useful in vaccines for treating or preventing a papilloma virus infection in an animal, particularly

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention comprises a nucleic acid molecule (DNA vaccine) that encodes a fusion polypeptide which is useful as a vaccine composition. The nucleic acid of the invention contains: a first nucleic acid encoding a polypeptide that promotes processing via the MHC class I pathway; a second sequence encoding a signal peptide; and a third sequence encoding an antigenic polypeptide. The DNA vaccine of the invention is useful for inducing or enhancing an antigen specific immune response, or to inhibit growth or prevent re-growth of a tumor expressing Human papillomavirus (HPV) E7 or E6 protein. The present amino acid sequence represents a human papillomavirus type 16 (HPV16) E7 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ₹

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to a method of ameliorating human papilloma virus (HPV) proliferation. The method involves administering an inhibitor of E7-induced cyclin-dependent kinases (CDK2) phosphorylation or an inhibitor of E7-binding CDK2 kinase complex that reduces HPV E7-induced CDK2 kinase activity. The present sequence is the human papillomavirus E7
                                                                                                                                                                                                                                                                Cytostatic; immunohistol
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Ameliorating human papillomavirus proliferation involves administering inhibitor of E7-induced cyclin-dependent kinases 2 phosphorylation or inhibitor of E7-binding cyclin-dependent kinases 2 kinase complex that reduces kinase activity.
New combination of antibodies comprises an anti-HPV-16 E7 antibody and anti-HPV-18 E7 antibody, useful for preparing a diagnostic composition

Length 98;

```
This sequence represents human papillomavirus-16 (HPV-16) E7 protein. An CC antibody raised against this protein may be used in a combination of cantibodies which comprises an anti-HPV-16 E7 antibody obtainable by CC eliciting an in vivo humoral response against HPV-16 E7 protein or its cfragment in a goat, and affinity-purifying antibodies as obtained in the CC eliciting step, and an anti-HPV-18 E7 antibody. The combination of antibodies is useful for the preparation of a diagnostic composition for the (immuno-) histological detection of high risk HPV E7 protein. The CC (immuno-) histological detection is carried out on Pap-emears, cervical (Carcinoma) biopsies, anogenital biopsies, mamma biopsies, head- or neck biopsies, or prostate biopsies. The diagnostic composition is used for cancer, for measuring the status of an existing sexually transmitted disease or cancer, or for screening therapy efficiency in the treatment CC disease or cancer, or for screening therapy efficiency in the treatment CC disease is a high risk HPV infection or where the cancer is cervical cancer, breast cancer/mamma cancer, prostate cancer, head and neck cancer, breast cancer, and/or anogenital cancer/meoplasia (AIN). The
                                                           combination of antibodies or the diagnostic composition are useful in an in vitro method for the detection of high risk HPV 27 protein. The antibody is useful for detecting E7 protein of HPV-31, HPV-35, HPV-45, HPV-52, HPV-56, HPV-58, and/or HPV-59. It is also useful for the preparation of a diagnostic composition for detecting E7 protein of HPV-16, HPV-18, HPV-31, HPV-33, HPV-35, HPV-45, HPV-52, HPV-56, HPV-58, and/or HPV-59.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Example 2; SEQ ID NO 2; 146pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ঠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  cc acid vector comprising a first sequence encoding an antigenic polypeptide cor peptide, and optionally, a second sequence linked to the first cor sequence and encoding an immunogenicity-potentiating polypeptide (IPP); cc and a second nucleic acid vector encoding an anti-apoptotic polypeptide. cc when the second vector is administered with the first vector to a cc subject, a T cell mediated immune response to the antigenic polypeptide. cor peptide is induced that is greater in magnitude and/or duration than cc an immune response induced by administration of the first vector alone. cc minimum ersponse induced by administration of the first vector alone. cc witable for introduction into a cell or an animal by particle composition; a pharmaceutical composition capable of inducing or composition; a pharmaceutical composition capable of inducing or capable of inducing an antigen specific immune response, comprising the particle commune response in a subject; increasing the numbers of CD8+CTLS and a carrier or an excipient; inducing or enhancing an antigen specific commune response in a subject. The nucleic acid composition is useful as an immunogen for inhibiting the growth of a tumor in a subject. The nucleic acid composition is useful as cc an immunogen for inhibiting the growth of a tumor in a subject. The nucleic acid composition is useful as cc yetostatic acitivity. This sequence represents ananti-apoptotic vector HPV cc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Matches

The invention relates to a method of producing a synthetic protein CC comprising an amino acid sequence that is at least 80% identical to a CC naturally occurring antigenic protein of a pathogen or tumor comprising CC chemically synthesizing two or more fragments, chemically ligating the C-CC produce the synthetic protein or its part and optionally repeating the CC second step to sequentially ligate a further neighboring fragment to CC composition of the second step. The invention also relates to a CC composition comprising the protein and a method for treating or CC to the subject the protein or composition in a therapeutically effective amount. In producing a synthetic protein, the neighboring non-overlapping CC fragments are selected to comprise N-terminal cysteine or glycine cresidues. The naturally occurring protein is an HPV protein, e.g. E2, E6 CC residues. The naturally occurring protein is an HPV protein, e.g. E2, E6 CC residues. The reventing or treating HPV associated disease, such as a CC concer. This sequence represents an HPV16 E7 protein used in the method control of the method control of the subject of the subject of the subject of treating or treating HPV associated disease, such as a CC cancer. This sequence represents an HPV16 E7 protein used in the method control of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Producing a synthetic protein of a pathogen or tumor comprises chemically synthesizing two or more fragments of 2-80 contiguous amino acids of sequence, the sequence of two or more fragments are neighboring and non-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ঠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        문
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a new polynucleotide comprising a multi-epitope CC construct comprising nucleic acids encoding the human papillomavirus CC (HPV) cytotoxic T lymphocyte (CTL) epitopes e.g., HPV16.ER1.214, and that CC are directly or indirectly joined to one another in the same reading frame, a vaccine minigene. Also included are a vector comprising the CC multi-epitope construct, a polypeptide comprising an amino acid sequence encoded by the polynucleotide, a composition (comprising the CC polynucleotide, vector and/or polypeptide and a carrier), a cell CC (comprising the polynucleotide, vector or polypeptide), inducing an CC (comprising the polynucleotide, vector or polypeptide), and making the CC polynucleotide, vector or polypeptide. The epitopes are derived from CC different strains of HPV and are from the E1, E2, E6 and E7 proteins. The CC epitopes may be linked via a GP-anchor/spacer peptide. The order of the cpitopes in the vaccine protein are disclosed in the tables referred to CC polypeptide is useful in preparing a composition for inducing an immune CC defense against human papillomavirus virus (HPV) and thus providing a CC defense against HPV infection and HPV-related cancers. The present convertion is an HPV protein used to derive epitopes for the vaccine of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Best Local Similarity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Chesnut Chen Y,

                                                              밁
                                                                                                                                                                                                                                     CC Construction surfaces to the polymerocate comparison papillomavirus (HPV) cytotoxic Tlymphocyte (CTL) epitopes e.g., HPV16.E1.214, and that CC are directly or indirectly joined to one another in the same reading CC frame, a vaccine minigene. Also included are a vector comprising the CC multi-spitope construct, a polypeptide comprising an amino acid sequence CC encoded by the polymucleotide, a composition (comprising the CC polymucleotide, vector and/or polypeptide and a carrier), a cell CC (comprising the polymucleotide, vector or polypeptide), inducing an CC immune response against human papillomavirus virus (HPV) and making the CC polymucleotide, vector or polypeptide. The epitopes are derived from CC different strains of HPV and are from the El. E2. E6 and E7 proteins. The CC epitopes may be linked via a GP-anchor/spacer peptide. The order of the CC epitopes in the vaccine protesin are disclosed in the tables referred to CC in the claims of the specification. The polymucleotide, vector or polypeptide is useful in preparing a composition for inducing an immune CC response against human papillomavirus virus (HPV) and thus providing a CC defense against human papillomavirus virus (HPV) and thus providing a composition of the vaccine of the composition.
                                                                                                                               Matches
                                                                                                                                             Query Match

The second protein is taken from a group including human Lymphocyte Activation Gene (hLAG)-3. The first protein is a viral or bacterial antigen, a tumor antigen, parasitic antigen, or their mixtures. The viral antigens can be for hepatitis B (HBV), human papillomavirus (HPV), hepatitis C (HCV), human immunodeficiency virus (HIV), Epstein-Barr virus (BBV), cytomegalovirus (CMV), and their combinations. The bacterial antigens can be intracellular bacteria of tuberculosis, leprosy and listeria. A vaccine of the invention has virucide, and antibacterial activity. The present sequence represents the HPV16 wild-type E7 protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Therapeutic vaccine, for viral and bacterial conditions, comprises antigen protein and a viral or bacterial protein, coupled together stable hydrogen or covalence bonds in biological media.

                                                                                                                                                                             Gene expression; therapeutic; immune acquired immune deficiency syndrome;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to fusion protein comprising papilloma virus-specific (PVS) protein and their encoding polynucleotides. The invention is useful in preparing a composition for treating and preventing papilloma virus infection in humans. The present sequence the Human papillomavirus type 16 E7 protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ঠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                문
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  the same protein or polypeptide as a wild-type polynucleotide. The invention also relates to a method for enhancing expression of a gene, a method of preventing or treating a disease in a mammal, a composition comprising a modified polynucleotide describe above and a pharmaceutical vector. The method additionally comprises adding an immunoglobulin leader sequence, such as an IgE leader sequence, to the modified polynucleotide. The composition is useful for preparing a medicament for inducing an immune response in a mammal or for treating an infection or condition, e.g. HIV or AIDS in a mammal. The polynucleotide and methods are useful for enhancing gene expression. This sequence represents the HPV16 E7 protein used in the scope of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Preparing a polynucleotide, useful for enhancing comprises assembling oligonucleotides comprising a modified polynucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a method of preparing a polynucleotide that provides enhanced expression of a gene, comprising assembling oligonucleotides comprising surrogate codons to form a modified polynucleotide, comprising a predetermined nucleic acid sequence encoding polynucleotide, comprising a predetermined nucleic acid sequence.
                                                                                                                                                                                                                                                                                                                                                                                    22-OCT-2002; 2002RU-00128131
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human papillomavirus; HPV16
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             HPV16 E7

The invention relates to composition of recombinant proteins, method for preparing the composition, pharmaceutical kit of reagents used in immunotherapy and prophylactic vaccination of tumour diseases in anal-genital region and methods for immunotherapy and prophylactic vaccination. The fusion proteins are used in immunotherapy and prophylactic vaccination of tumour diseases in anal-genital sphere. The present sequence is the HPV16 E7 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Antibody; monoclonal antibody; antibody production; hybridoma; screening; E7 oncoprotein; immuno-diagnosis; diagnostic; immunoconjugate; immunoassay; radioimmunoassay; enzyme-linked immunosorbent assay; transmissible spongiform encephalopathy; cerebroprotective; cervical intraepithelial neoplasia; cytostatic; immunoglobulin.
The new invention relates to methods and compositions that allow production of antigen specific antibodies to antigens that have traditionally been unable to elicit an adequate and specific immune response. The method comprises producing monoclonal antibodies specito an antigen of low immunogenicity by chemically conjugating the ar
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 99 AA;
                                                                                                                                                                                                                                                 Producing monoclonal antibodies specific to an antigen of low immunogenicity by immunizing an animal with the chemically conjugated antigen, useful for detecting cervical intraepithelial neoplasia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human papillomavirus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     16-JUN-2005
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ADY92615;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   cc and a nucleotide sequence encoding HSP70 and transfecting a host cell cwith the plasmid. The nucleotide sequence encoding E7 oncoprotein comprises ADY92614. The nucleotide sequence encoding HSP70 cc comprises ADY92618. Alternatively, the conjugating is performed cc chemically using glucaraldehyde. Screening for specificity is done by cvarious assays such as radioimmunoassay, enzyme-linked immunosorbent cc assay, or sandwich immunoassay. The antibodies are useful for determining cf a subject is at risk of developing spongiform encephalopathy cc comprising an antibody that specifically detects Prion protein. The Prion cc protein peptide comprises ADY92619, ADY92620 or ADY92622. Antibodies specific to E7 oncoprotein are useful for detecting cervical cells and screening the specimen for the presence of E7 oncoprotein. The monoclonal antibodies comprise at least two immunoglobulin isotype is IgG2a or IgG2b. The immunoglobulin isotype has specificity for a different antigenic determinant than the second immunoglobulin isotype. The present sequence HPV16 E7 oncoprotein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        to a carrier molecule, immunizing an animal with the conjugated antigen, harvesting B cells from the animal, creating a hybridoma from the harvested B cells, and screening the hybridomas for specificity to the native antigen. The antigens can be E7 oncoprotein, Prion protein peptide, hyaluronic acid or matrix metalloprocease 3. The carrier molecule is HSP70. The chemical conjugation comprises creating a plasmid with a nucleotide sequence encoding the antigen, such as E7 oncoprotein

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence represents a HPV16 E7 protein. HPV16 E7 was fused to a heat shock protein (Hsp), and used used in the method of the invention. The specification describes a method of determining whether a compound stimulates a Thi-like response. Thi cells are a subset of CD4+ T lymphocyte cells. The method comprises contacting naive lymphocytes in vitro with a fusion protein comprising at least a fragment of Hsp, and then detecting the TH1-like response exhibited by the cell sample. The proteins which may be used in the method of the invention are Hsp65, Hsp40, Hsp10, Hsp60, and Hsp71. The method may be used to identify compounds that stimulate Th1-like responses in response to microbial
                                                                                                                                                                               Screening for compounds that stimulate Th1-like responses in CD4+lymphocyte cells.
                                                                                                                                                                                                                                                                              N-PSDB;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         specification describes a method of determining whether a compound stimulates a Th1-like response. Th1 cells are a subset of CD4+ T lymphocyte cells. The method comprises contacting naive lymphocytes in vitro with a fusion protein comprising at least a fragment of Hsp, and then detecting the TH1-like response exhibited by the cell sample. The proteins which may be used in the method of the invention are Hsp65, Hsp40, Hsp10, Hsp80, and Hsp71. The method may be used to identify compounds that stimulate Th1-like responses in response to microbial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 cytostatic; respiratory-Gen; antiasthmatic; vaccine; immunomodulator; immune response; atopic disease; allergy; seasonal respiratory allergy; perennial respiratory allergy; allergy; rhinitis; hayfever; nonallergic rhinitis; vasomotor rhinitis; irritant rhinitis; grass pollen allergy; weed pollen; tree pollen; animal danders; allergic asthma; food allergy; house dust mite allergy; fungal spore; cancer; tumour progression; T cell lymphoma; melanoma; lung cancer;
                                                                                                                                                                     New Fve polypeptide that is a fragment, homologue, variant or derivative of Fve protein and that comprises a biological activity of native Fve
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                28-OCT-2004.

This sequence represents a chimeric E6 or E7 protein or E6/E7 fusion protein from Human papillomavirus (HPV) linked to an immunological fusion partner, in this case, a fragment of the Haemophilus influenzae B protein D. The sequence also contains a histidine tag at the C-terminus of the encoded protein. The protein can be used in a vaccine, for immunotherapeutically treating HPV induced tumour lesions (benign or malignant) and preventing HPV viral infection. (Updated on 17-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAX78791-X78801 represent nucleic acid sequences which encode novel constructs comprising an E6 or E7 protein or E6/E7 fusion protein from HPV (represented in AAY25375-Y25386). These constructs are optionally linked to an immunological fusion partner and an immunomodulatory CpG oligonucleotide. The products of the invention can be used to induce a immune response in a patient to an HPV antigen. They can also be used preventing or treating HPV induced tumours
                                                                                                                                                                                                                                                                                                Human Papilloma Virus (HPV) fusion proteins - useful treatment or prophylaxis of HPV induced lesions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       17-OCT-2003

                                                                                                                                                                                 The invention relates to human Papilloma virus (HPV) fusion proteins, linked to an immunological fusion partner that provides T helper epitopes to the HPV antigen. Vaccine formulations comprising the fusion proteins are useful in the treatment or prophylaxis of HPV induced lesions (papillomas, warts and cervical cancer). HPV 16 (and HPV 18) E6 and E7 proteins (singly, as an E6-E7 fusion or mutated) were fused to either Haemophilus influenzae D protein (20-127), the C-terminus of Streptococcus pneumoniae Lyth protein (CLyth) or thioredoxin. The present sequence represents an HPV-H. influenzae D protein, fusion protein of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AAX78791-X78801 represent nucleic acid sequences which encode novel constructs comprising an E6 or E7 protein or E6/E7 fusion protein from HPV (represented in AAX75375-Y25386). These constructs are optionally linked to an immunological fusion partner and an immunomodulatory CpG oligonucleotide. The products of the invention can be used to induce arimmune response in a patient to an HPV antigen. They can also be used f preventing or treating HPV induced tumours
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Fusion protein; E6 protein; E7 protein; E6/E7; immunomodulator; tumour; immunological fusion partner; CpG oligonucleotide; immune response; HPV antigen; prevention; treatment.
